

CANON CORPUS — PROCESS BUCKET RE-SIFT REPORT

- Input (v1 sift): `synthetic_enrichment/generated/canon_corpus_semantic_sift.jsonl`
- Output (v2 sift): `synthetic_enrichment/generated/canon_corpus_semantic_sift_v2.jsonl`
- Generator: `scripts/_canon_process_resift_oneoff.py` (read-only against the corpus)
- Scope: re-evaluates only `v1 semantic_class == "PROCESS"` records; non-PROCESS records pass through unchanged.

1. INPUT PROCESS COUNT

1001 records were classified PROCESS in the v1 sift.

2. OUTPUT PROCESS COUNT

817 records remain PROCESS in the v2 sift.

3. NUMBER OF PROCESS RECORDS RECLASSIFIED

184 records were reclassified out of PROCESS during the re-sift.

Validation: **PASS** (every line parses as a JSON object; id-set equality and record count hold; allowed-class / allowed-confidence / boolean-review checks pass).

4. NEW COUNTS BY SEMANTIC_CLASS (WHOLE CORPUS, ALL RECORDS)

semantic_class	count
PERSON	617
PLACE	57
THING	50
IDEA	274
EVENT	71
RELATIONSHIP	30
CREATIVE_WORK	264
PROCESS	817
UNKNOWN	71

5. TOP 50 RECORDS REMAINING IN PROCESS

Bucket size after re-sift: **817**.

Selection: prefer high-confidence first, then those with a non-empty primary entity name, deprioritizing pure preface/skip rows.

id	source_path	primary_entity_name	reason
canon_projects_projects_json_provenance_skip_projects_json_skip_343_1efcedaaa1	canon/projects/projects.json	file	provenance_skip is a tooling artifact (re-sift confirms PROCESS)

8. RECOMMENDED NEXT SAFE ACTION

Convene the Weaver around section 7 (ambiguous review queue) and section 6 (top reclassifications), using the v2 sift as a diff against the v1 sift rather than as a movement instruction. The re-sift JSONL stays in synthetic_enrichment/generated/; nothing moves to synthetic_enrichment/validated/, nothing is written to hooplehopper_totality/, no training data is derived, and no record is marked [APPROVED_FOR_JSONL] outside the Human-in-the-Loop Quickstart loop. The next mechanical step is a Weaver spot-check of the top 50 reclassifications in section 6 and the top 50 remaining PROCESS rows in section 5; once those are confirmed or revised, a follow-up agent pass may enrich primary_entity_name and secondary_entity_names for the rows the Weaver has actually walked, and only then may a subsequent ticket route any subset into validated/ with explicit Weaver invocation.
